

Speaking Korean with Zero Consonants

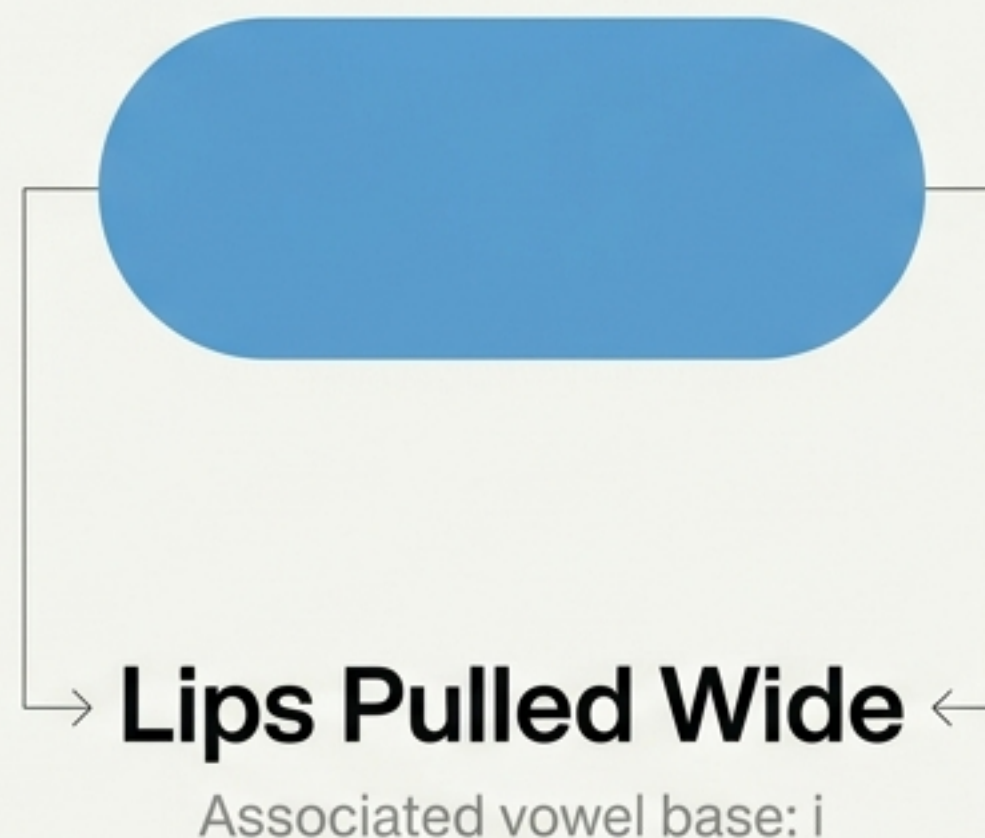

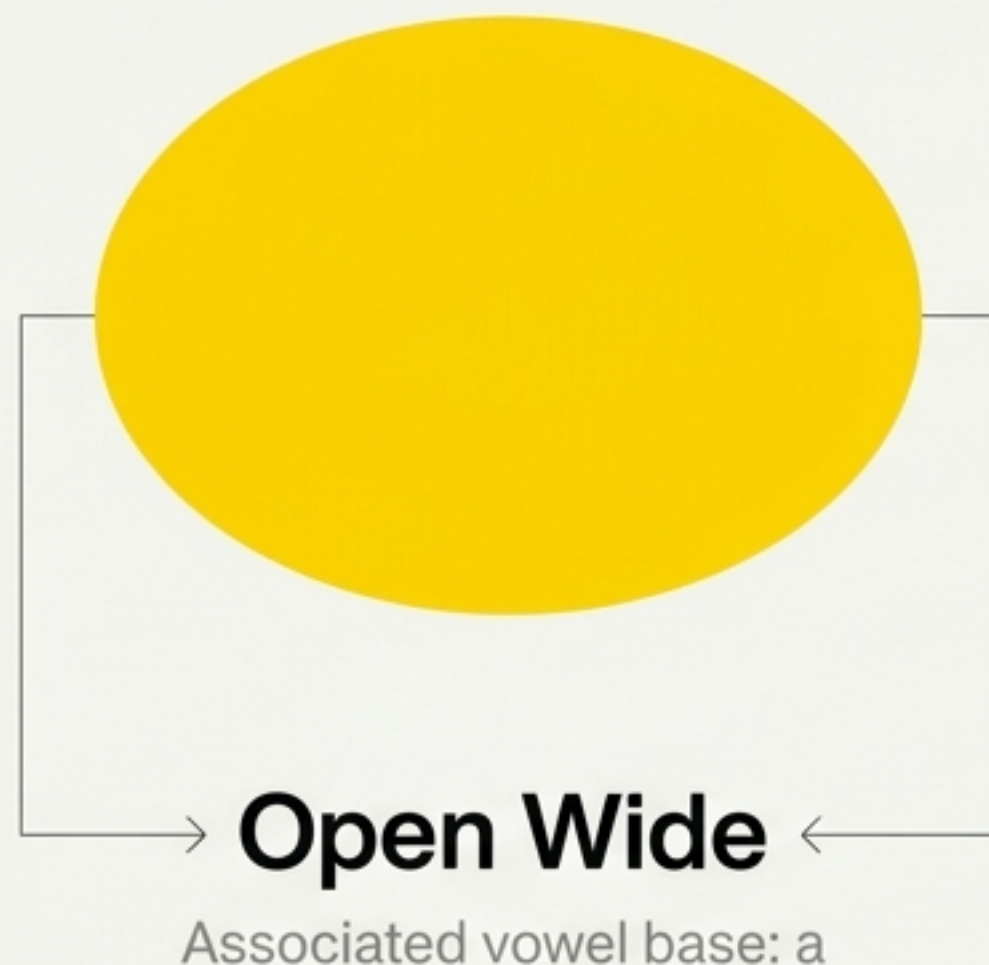

A visual guide to your first six words
using only the eight simple vowels.

[8 Vowels] + [0 Consonants] = Real Korean Words

The Mechanics of Articulation

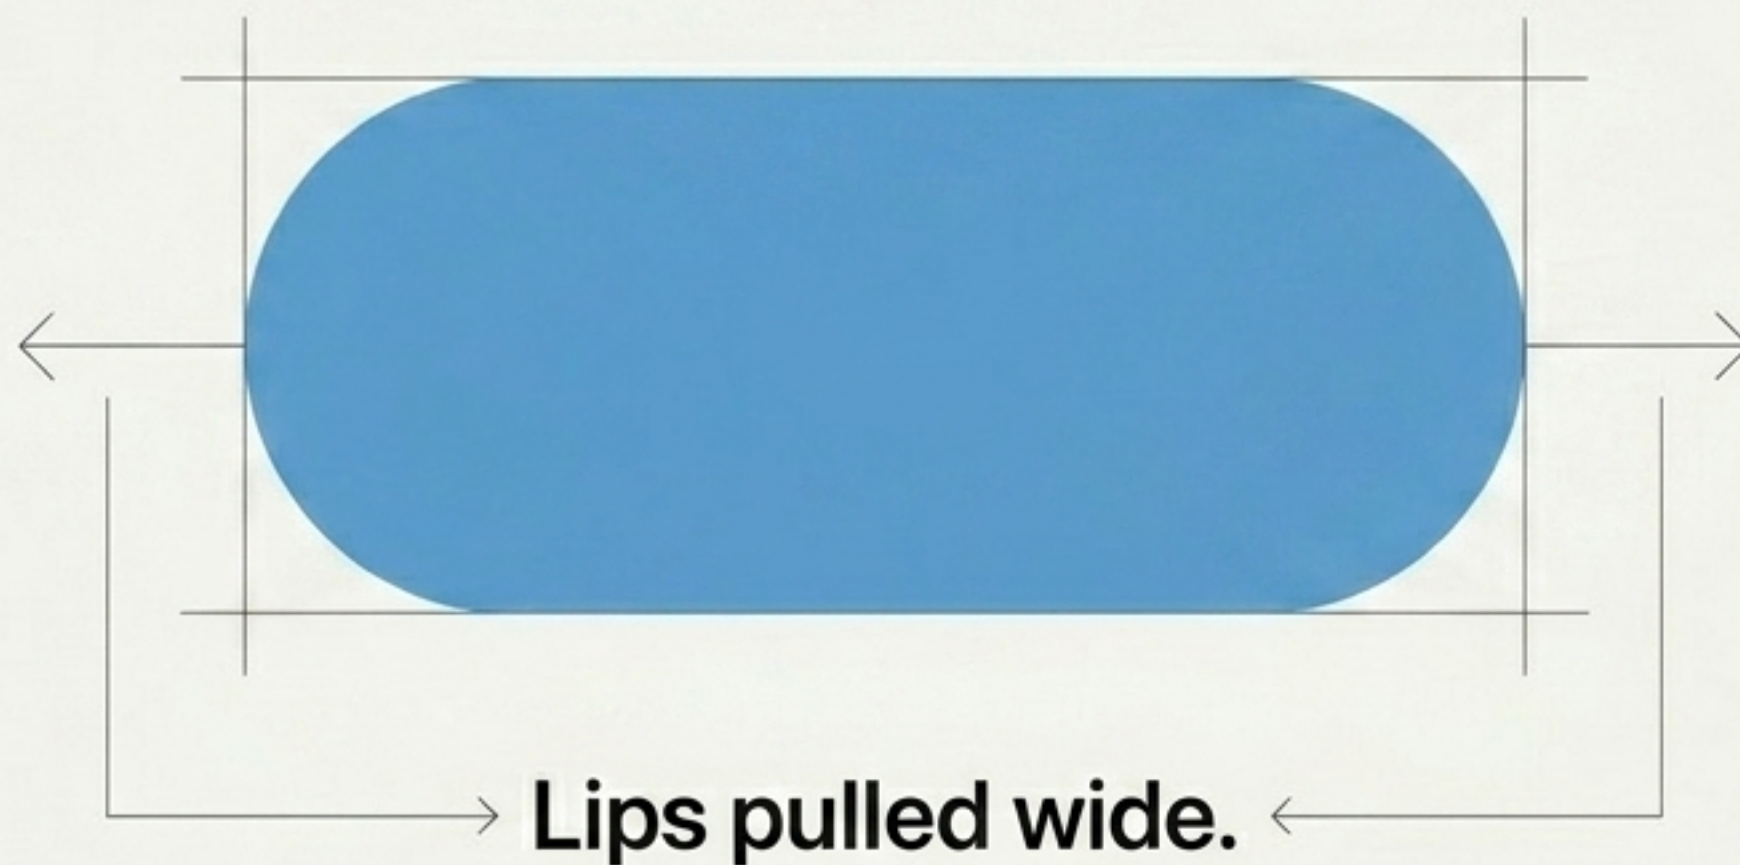

Every vowel we learned last time dictates a specific physical mouth position. We will use three geometric cues to guide your facial muscles.

i: Tooth

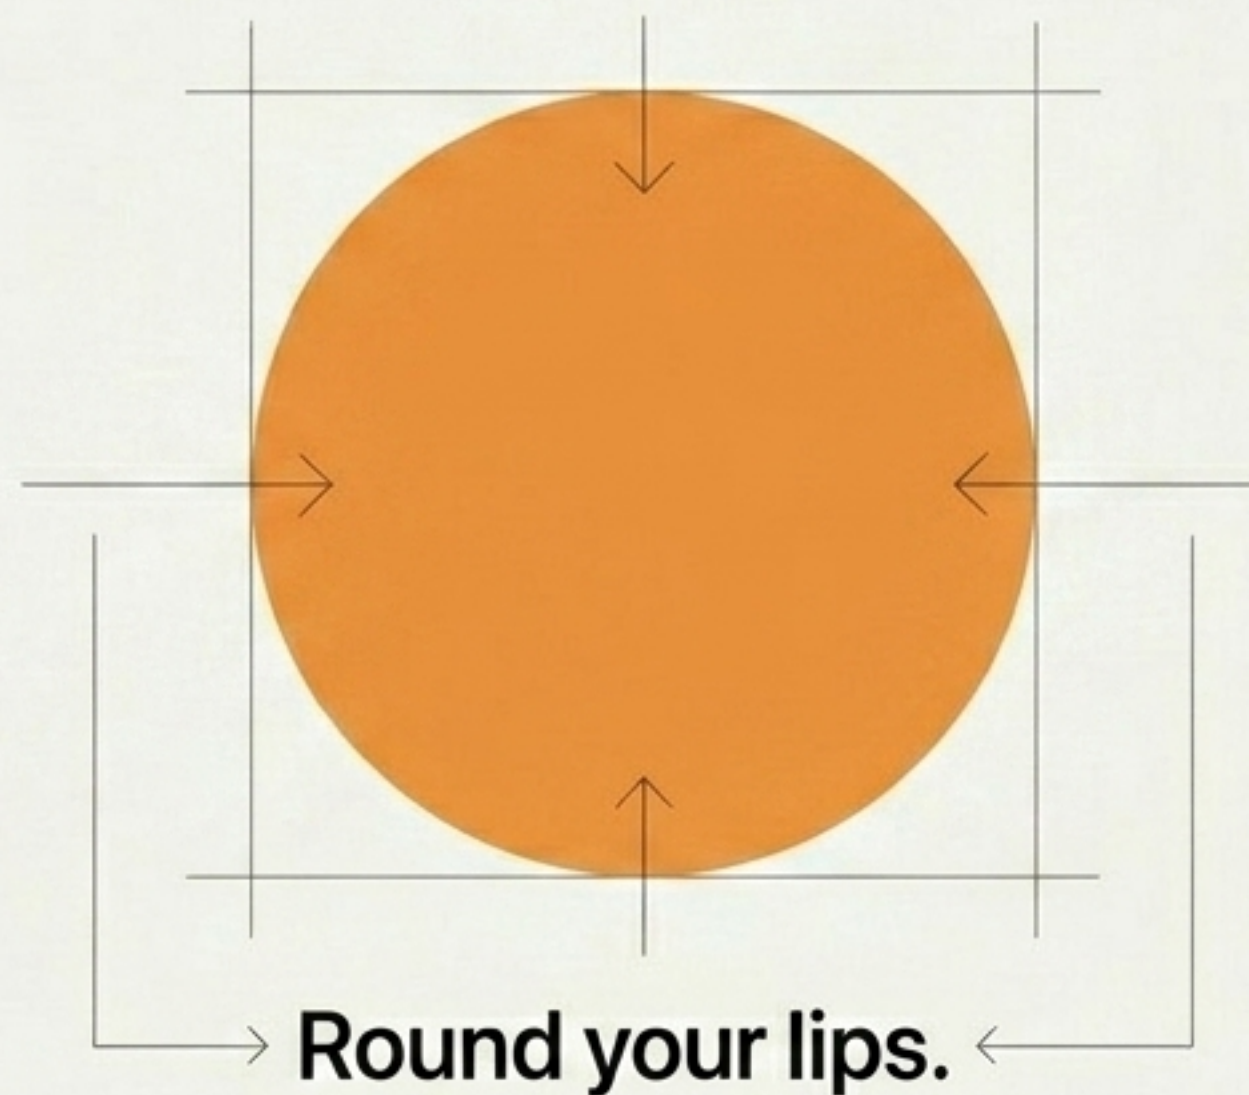

A single 'i' is already a complete word.

oi i

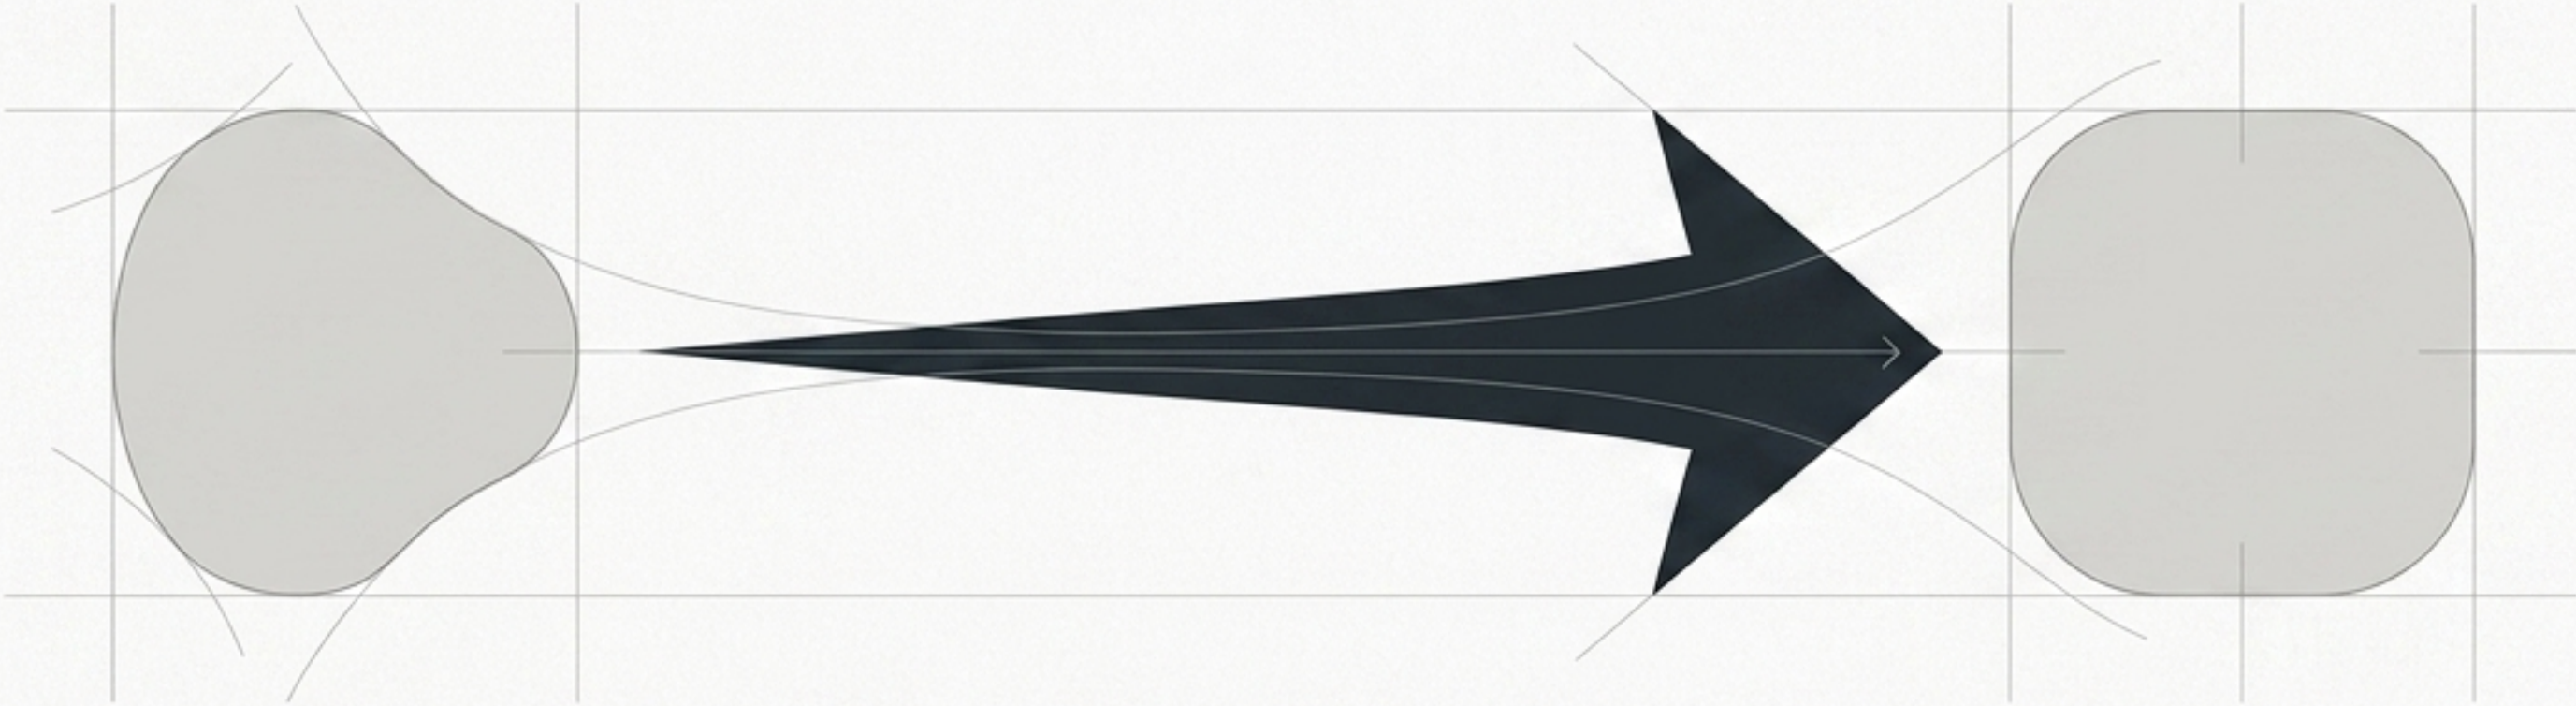

o: Surprised

The very sound you make when surprised — 'oh!' — is itself a word.

Creating Flowing Sounds

Most early vowel-only words require a transition. By sliding your mouth from one geometric position to another, you construct entirely new meanings without adding any consonants or batchim.

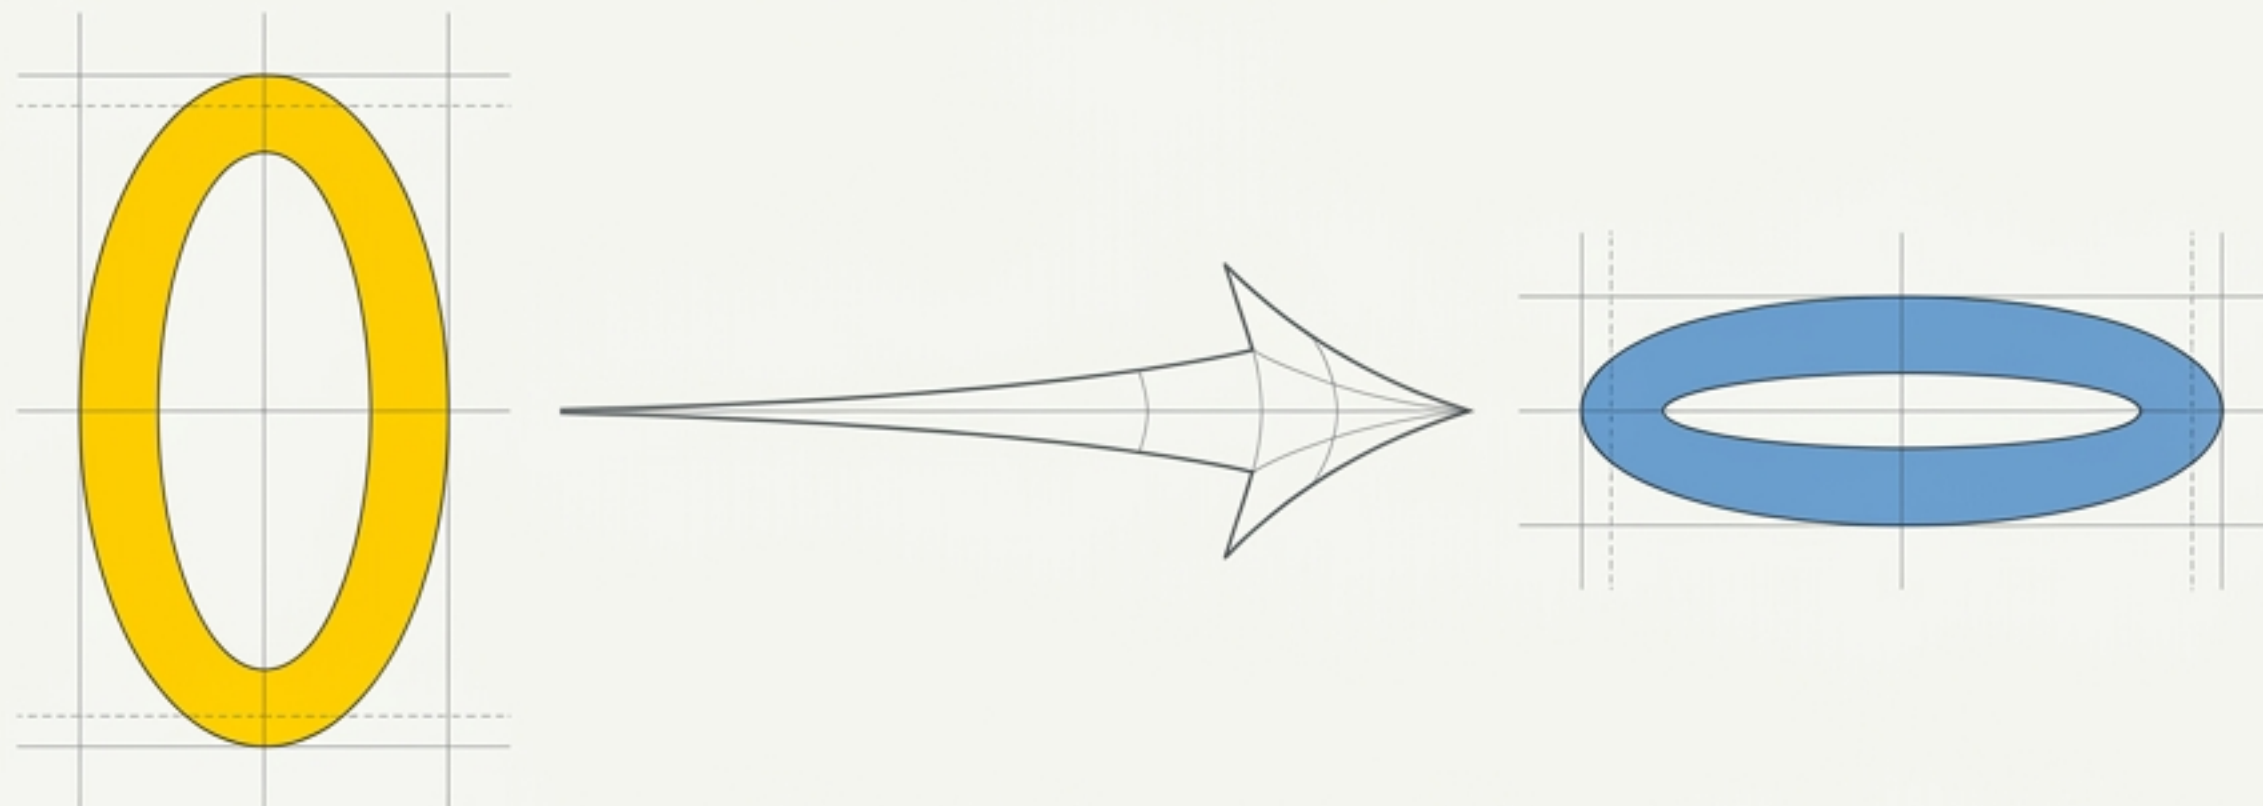

[Vowel 1] → Smooth Transition → [Vowel 2]

ai: Child

A word made of just two vowels.
Say it with me: ai.

아이 (ai)

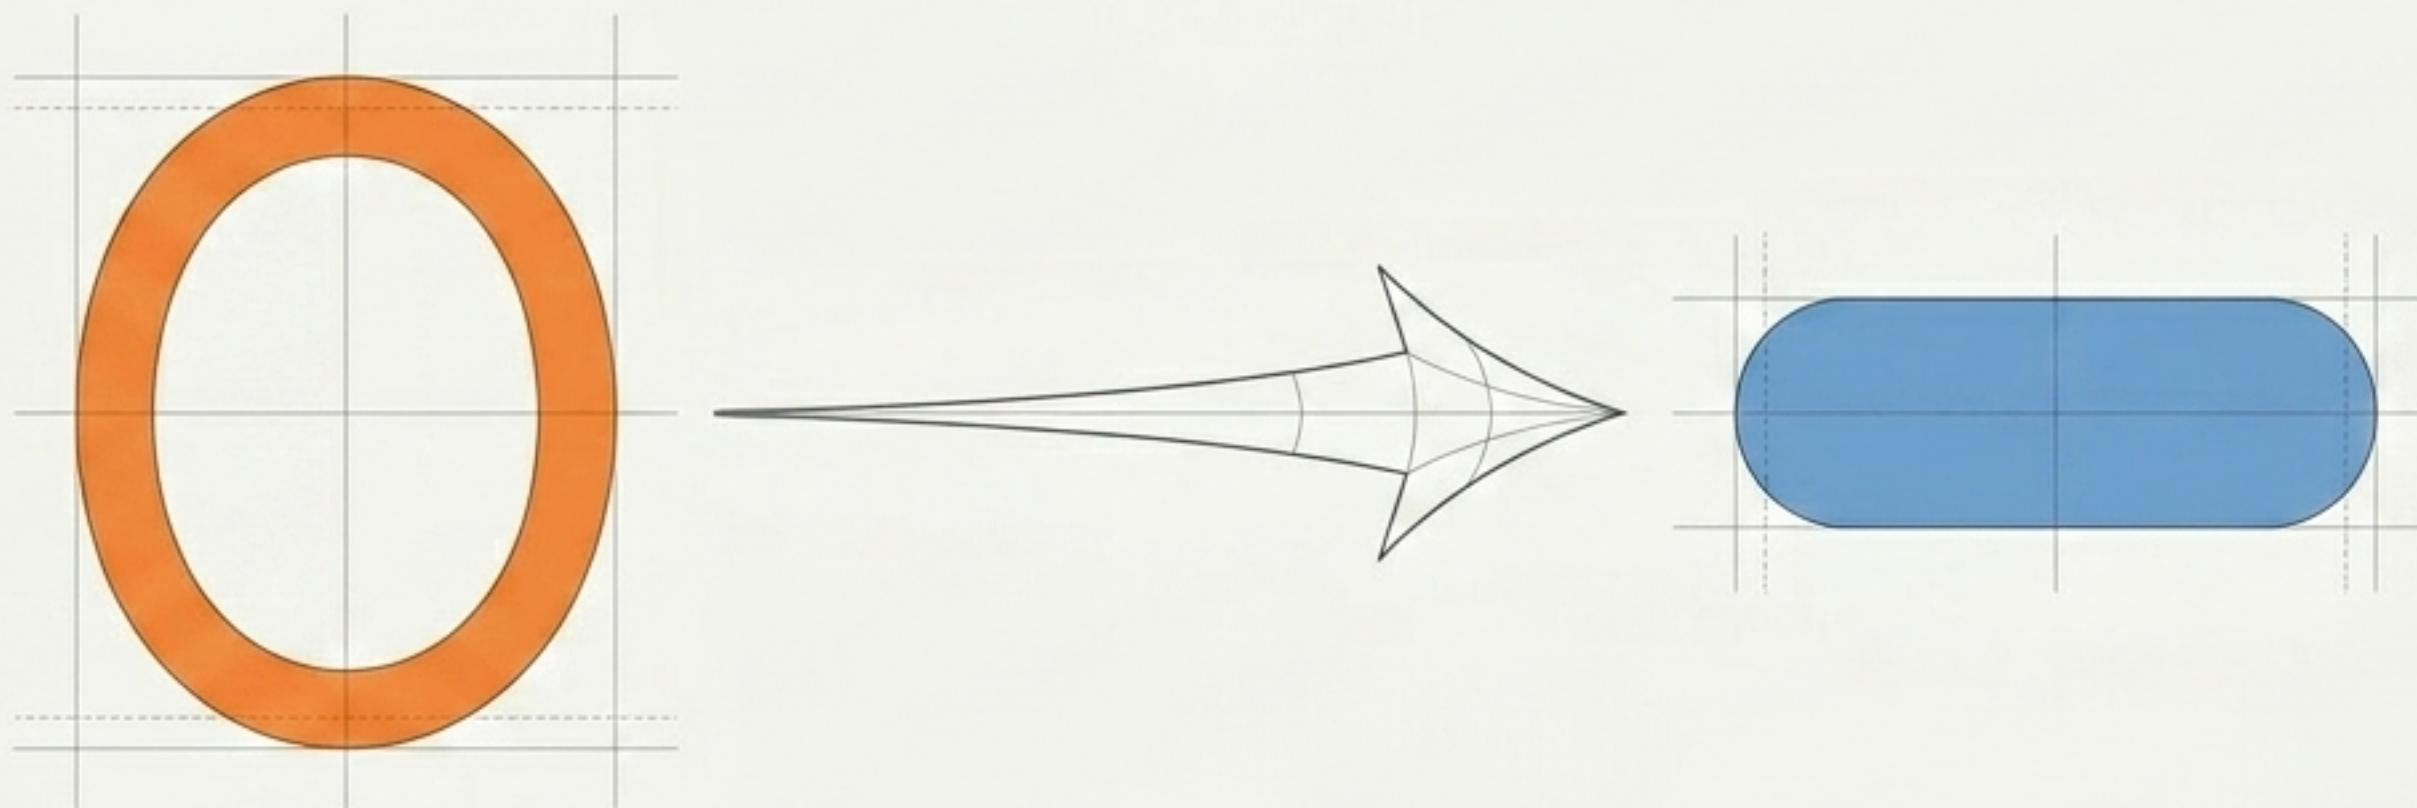

[1] Open wide for 'a' → [2] Transition → [3] Pull lips wide for 'i'.

oi: Cucumber

A crunchy green cucumber. Again, two vowels with no batchim.

오이 (oi)

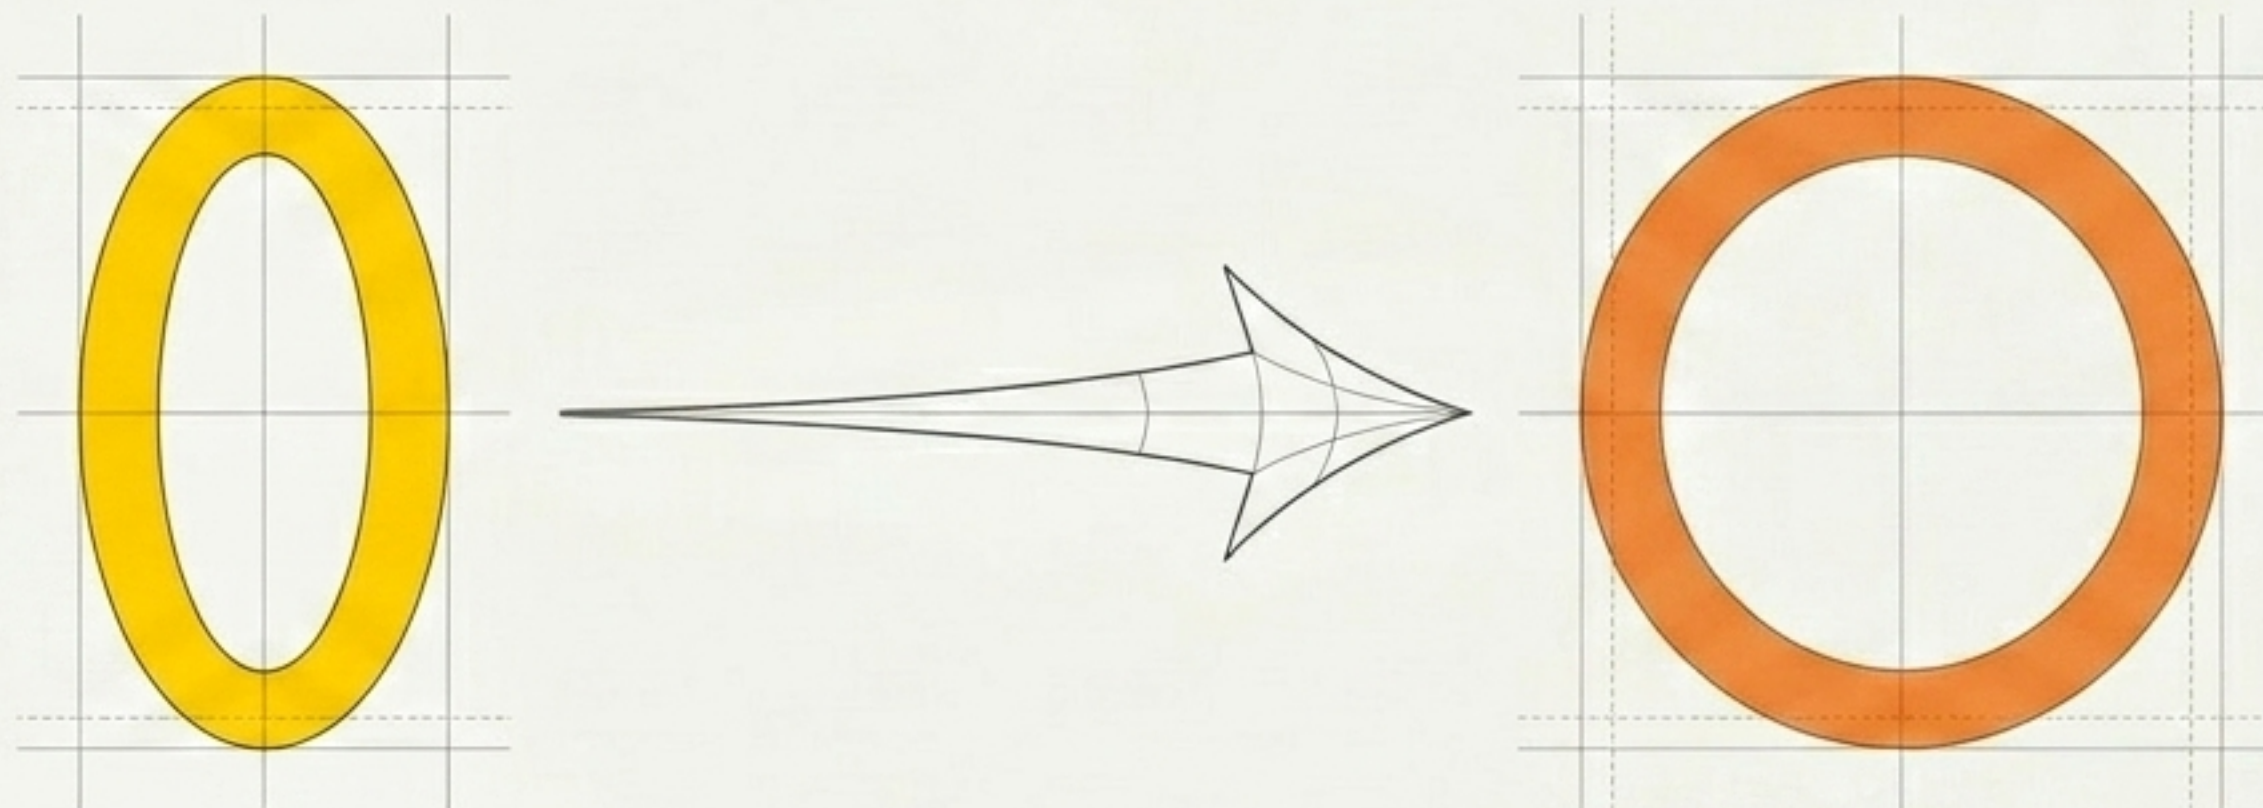

[1] Round your lips → [2] Transition → [3] Pull them wide.

au: Younger Sibling

A warm word for a younger sibling.

아우 (au)

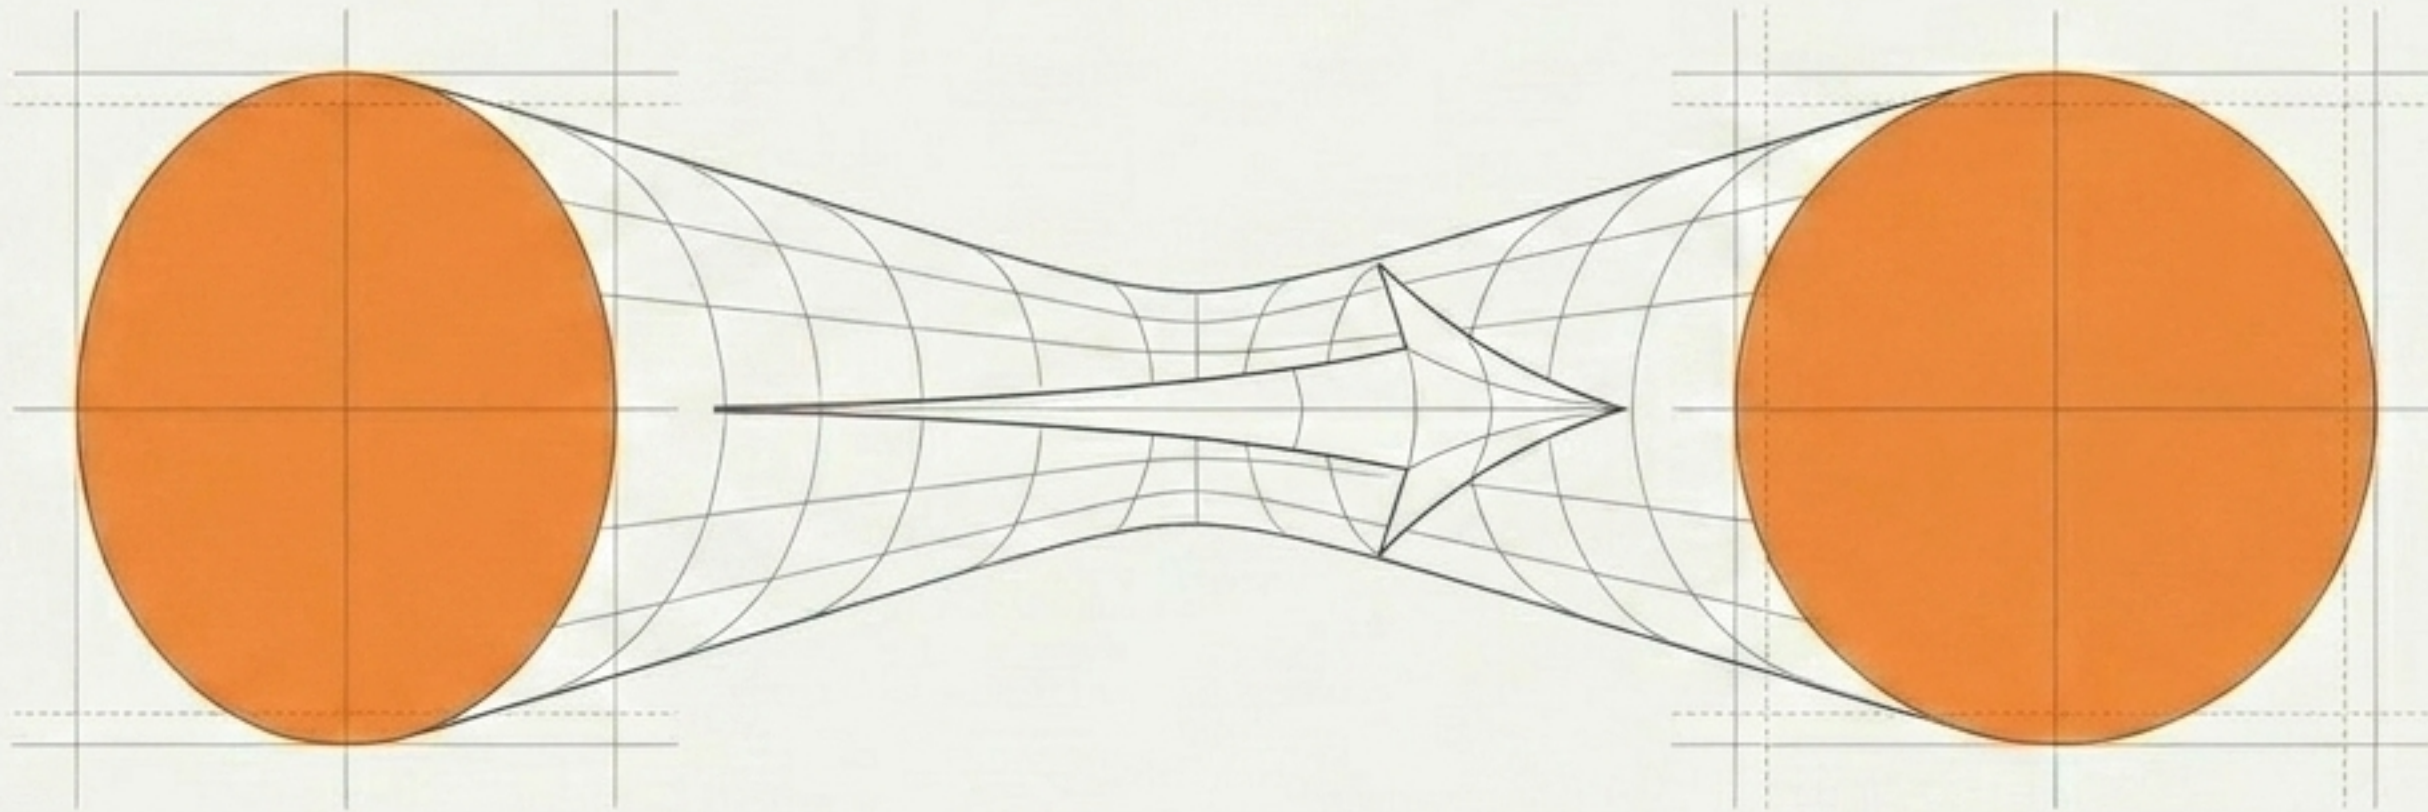

[1] Open wide for 'a' → [2] Transition → [3] Round for 'u'.

uyu: Milk

Sweet white milk. Both sounds demand prolonged rounding. Slowly now: uyu.

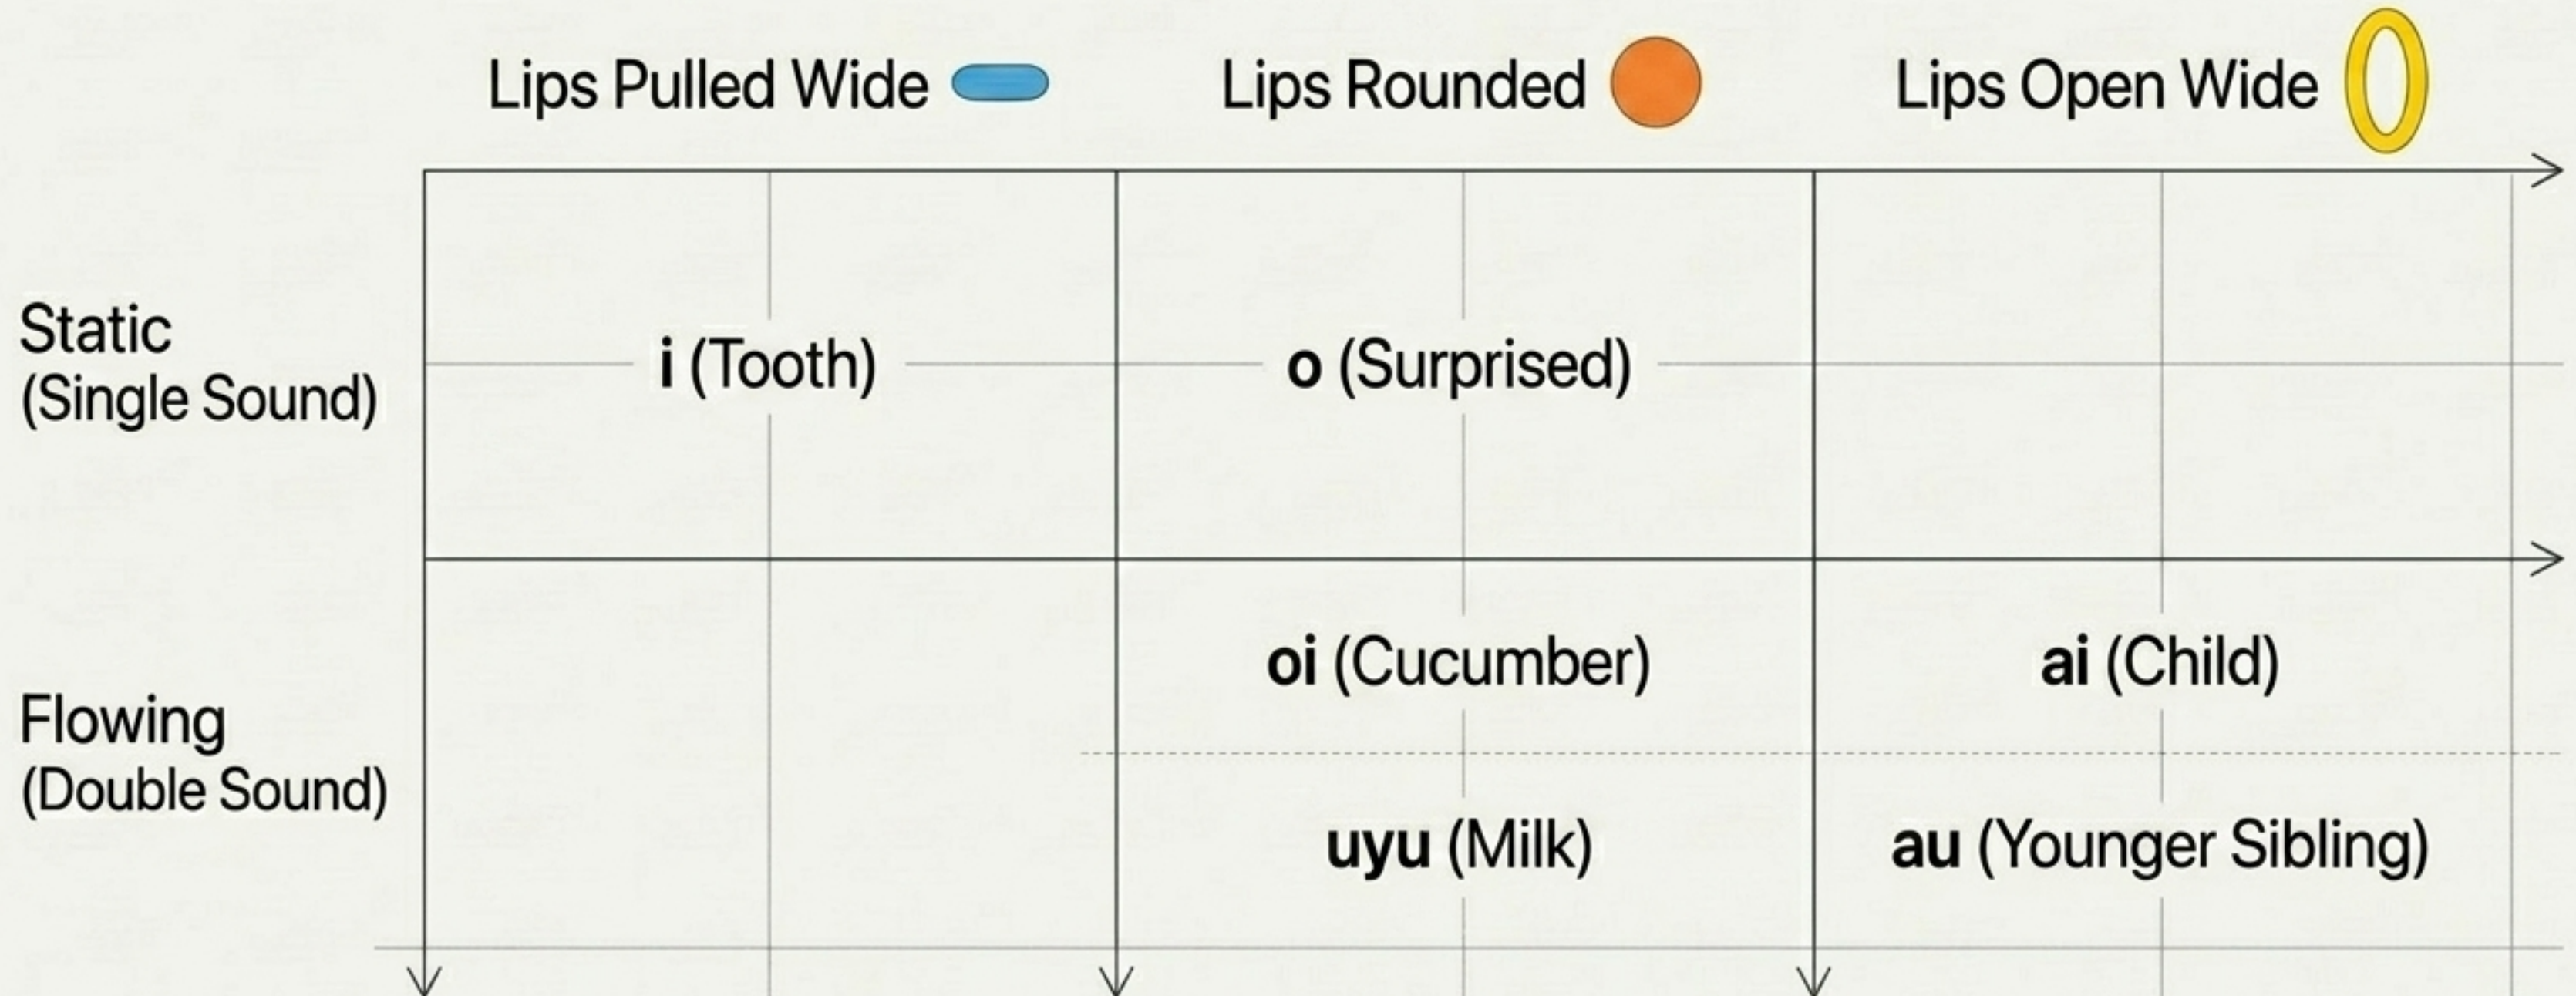

우유 (uyu)

Push the lips forward and round for 'u', and push forward again for 'yu'.

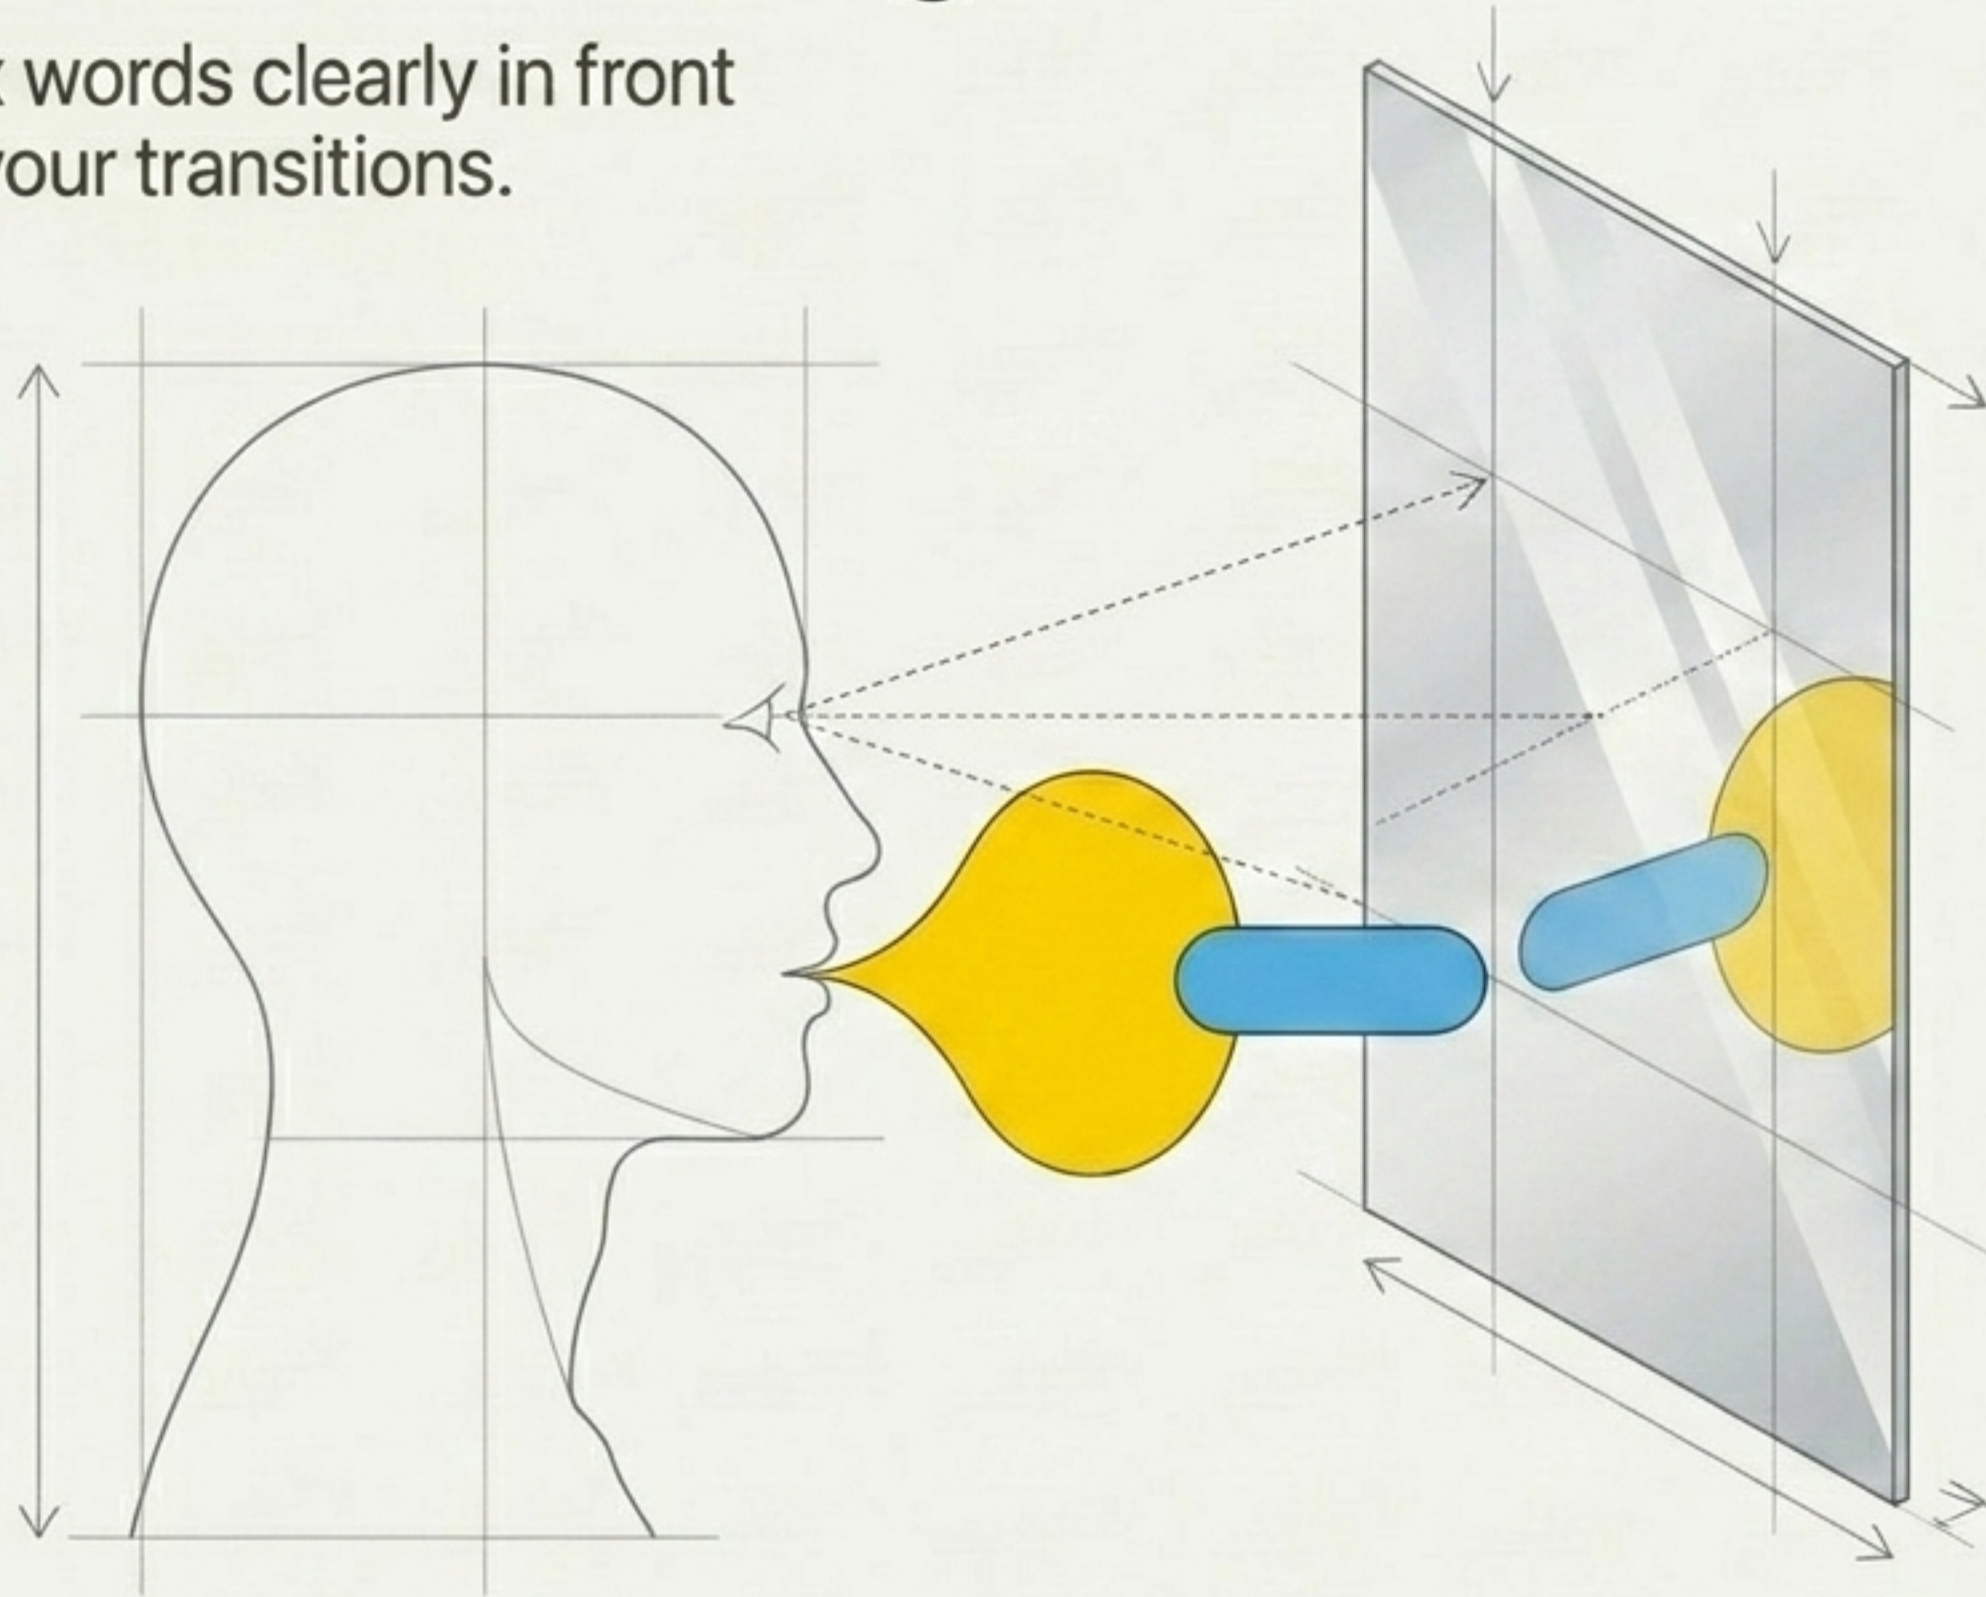

The Vowel Architecture Matrix

Six real words, zero consonants, entirely governed by starting mouth position and physical transition.

The Articulation Challenge

Practice today's six words clearly in front of a mirror. Watch your transitions.

The Architecture Expands

You have mastered the vowel foundations. Next time, we add consonants to build even more words. See you soon.
