

The Physical Geometry of Hangul

Pronunciation is not just sound—it is the exact physical positioning of your jaw, lips, and breath. Look in the mirror.

Three Mechanical Axes Define Korean Vowels

The Y-Axis: Jaw Drop

Closed to Wide Open

The X-Axis: Lip Spread

Neutral to Corners Pulled

The Z-Axis: Lip Protrusion

Flat to Pushed Forward

Every Korean single vowel can be perfectly reproduced by adjusting these three physical dials.

The Anchor Shape Requires Maximum Jaw Extension

Jaw Drop

Wide Open

Lip Spread

Lip Protrusion

Character: ʌ (A)

Instruction: Open your mouth wide and say "Ah!"

Focus: Your physical mouth shape is the foundation of the sound.

Dropping the Jaw Narrows the Aperture

Character: ┆ (Eo)

Transition: Open your mouth slightly less wide than for 'A', and drop your jaw slightly.

Result: The 'Eo!' sound emerges naturally as the pronunciation changes with the geometry.

Pushing Forward on the Z-Axis

$\perp (O)$: Round your lips slightly forward and say 'Oh!' — You need to move your lips well.

Lip Protrusion

$\top (U)$: Round your lips even more forward than for 'O' and say 'Oo!' — Your lips must protrude visibly further.

Lip Protrusion

Activating the Horizontal Spread

— (Eu): Pull your lips slightly to the sides without opening your mouth wide. Say "Eu!" Don't move your lips too much.

| (I): Pull the corners of your mouth wide to the sides, as if you're smiling broadly. Say "Ee!" (Often the easiest shape to master).

Calibrating the Aperture Ring

- From 'Ee' to 'Ae': Open your mouth slightly wider than for 'Ee' and say 'Ae!'

- From 'Ae' to 'E': Open your mouth slightly less wide than for 'Ae' and naturally say 'Eh!'

- Observation: 'Ae' and 'E' are similar, but defined entirely by slight modifications in mouth openness.

The Vowel Geometry Matrix

Translating Mechanics into Greetings

Annyeong! Naneun Minho imnida.

Apply the shapes to the real world.

Speak the greeting with confidence, linking the mechanical jaw and lip movements together.

Muscle Memory Requires Consistent Practice

The mouth is an instrument.
Pronouncing Korean single
vowels and greetings correctly
is entirely about physical
positioning.

Consistent practice is the most
important factor in locking
these geometric shapes into
muscle memory.

**See you
next time.**
